

- Change your clothes and shoes before coming inside your home if you work around lead or have a hobby that involves lead.
- Remove surface soil if it's contaminated with paint chips.
- Have your home tested for lead hazards. Contact 574-875-3391 for a list of contractors.

- Don't store food or beverages in lead crystal glassware or imported or old pottery.

- Make sure the child eats right. A child who gets enough iron and calcium will absorb less lead. Foods rich in iron include eggs, lean red meat, and beans. Dairy products are high in calcium.

"Dedicated to a Healthful Life and Environment"

Who's At Risk?

If you answer yes to any of the following questions you should have your child tested for lead.

- Does your child live in or regularly visit a house or child care center built before 1978?
- Does your child have a sibling or playmate who has or did have lead poisoning?
- Does anyone in your household work in an industry or have a hobby that uses lead (battery factory, steel smelter, stained glass)?

What Is Lead?

Lead is a bluish-gray metal that may have a sweet taste. It is often used in products such as paint and water pipes because it makes products more durable and

helps prevent corrosion. Lead is especially common in homes built prior to 1978.

Symptoms of Lead Poisoning

Long term effects of lead in a child can be severe including learning disabilities, decreased growth, hyperactivity, impaired hearing, and even brain damage or death. If discovered early, these effects may be limited by reducing exposure to lead or by medical treatment. If you are pregnant, avoid exposing yourself to lead. Lead can pass through your body to your baby.

Lead Hazards

There are many potential sources of lead hazards including:

- Lead dust created when doors, windows or other painted surfaces rub against each other.
- Peeling lead based paint (inside or outside).

Lead based paint may look like "alligator skin."

- Water contaminated with lead from soldering in plumbing.
- Soil, especially in bare spots, with lead from peeling exterior paint.
- Numerous other items such as painted toys, batteries, keys, and imported items such as candies, ceramics, folk remedies, and cosmetics.

Where to Have Children Tested

Even children who appear healthy may have high levels of lead. You can't tell if a child has lead poisoning unless you have him or her tested.

The CDC (Centers for Disease Control) recommends that children be tested for the first time when they are 6 months to 1 year old and every year if your house or apartment may contain lead paint, or if you use lead in your job or hobby.

How to Reduce Exposure

- Keep areas where children play clean and free of dust.
- Mop floors and wipe window ledges and chewable surfaces with a solution of powdered automatic dishwasher detergent in warm water.
- Wash toys and stuffed animals regularly.

- Have your child wash his or her hands before meals, nap time, and bed time.
- *Make sure your child does not chew on painted or varnished surfaces, such as window sills, cribs, or playpens.*
- You should not remove lead paint yourself unless absolutely necessary. Contact the Elkhart County Health Department at 574-875-3391 for tips on how to safely remove the paint. Families have been poisoned by scraping or sanding lead paint because these activities generate large amounts of lead dust.

- Consider encapsulation (painting or sealing to cover) of peeling paint versus removal. Contact 574-875-3391 for information on encapsulation.
- Use cold water for drinking and cooking and let it run for 30 seconds to flush your pipes of lead.

- Clean your carpets every year with wet cleaning methods. Vacuum regularly using a vacuum equipped with a HEPA (High Efficiency Particulate Air) filter.
